THE NECESSARY AND SUFFICIENT CONDITION OF 
\( e \rightarrow C \leftarrow e \) AS A CLEAN \( R \)-COALGEBRA

Abstract. Let \( R \) be a commutative ring with multiplicative identity and \( C \) be a coassociative and counital \( R \)-coalgebra with the \( \alpha \)-condition. A clean comodules defined based on the cleanness on rings and modules. A \( C \)-comodule \( M \) is a clean comodule if the endomorphism ring of \( C \)-comodule \( M \) is clean. A clean \( R \)-coalgebra \( C \) is a clean comodule over itself i.e., if the endomorphism ring of \( C \) as a \( C \)-comodule is clean. For an idempotent \( e \in R \), there are relations between the cleanness of \( eRe \) and \( R \). It’s motivated us to investigate this condition for coalgebra. For any \( C \), we can construct the \( R \)-coalgebra \( e \rightarrow C \leftarrow e \) where \( e \) is an idempotent element of dual algebra of \( C \). Here, we show that the clean conditions of \( C \) implies the clean property of \( e \rightarrow C \leftarrow e \) and vice versa.

Keywords: coalgebra, clean coalgebra, clean comodule, corner ring

1. INTRODUCTION

Throughout \( R \) is a commutative ring with multiplicative identity, \((C, \Delta, \varepsilon)\) a coalgebra over \( R \), which we assume to be coassociative and counital over multiplication. In the beginning, we need to recall some notions in ring theory, i.e., clean rings, which is introduced by [1]. A ring \( R \) is said to be clean where any element of \( R \) can be expressed as a sum of \( e \) and \( u \), where \( e \) is an idempotent and \( u \) is a unit in \( R \). The examples of clean rings are Von Neumann regular rings and fields. The clean rings is a subclass of the exchange rings. Some authors studying the property of being clean or the exchange property are [1, 2, 3, 4, 6, 7, 8, 9].

Any \( R \) can be considered as a module over itself. Furthermore, the endomorphism ring of \( R \) over \( R \) (i.e., \( \text{End}_R(R) \)) isomorphic to ring \( R \). Consequently, \( R \) is clean if and only if \( R \) is also a clean module over \( R \). Some researchers have been
Based on this fact, we have that ring $R$ is a comodule over $\varepsilon$ of $C$ concept of the category $\text{RING}$ and the category of modules ($\text{M}_R$) ring of endomorphism ring of $R$ over $R$ (denoted by $\text{End}_R(M)$) is clean.

In [14], Sweedler introduced the dualization of the algebra over a field. He has introduced the theory of coalgebra over a field. The concept of a coalgebra over a field can be generalized to the concept of a coalgebra over a ring [15]. In [15] reversing the scalar multiplication between $M$ over a field can be generalized to the concept of a coalgebra over a ring [15]. In this paper, the homomorphisms $R$-module $C$ to $R$ denoted by $C^*$, i.e., $C^* = \text{Hom}_R(C, R)$. Here, $C^*$ is an algebra (ring) over a convolution product

$$f * g = \mu \circ (f \otimes g) \circ \Delta$$

where $\mu$ is a multiplication of $R$ and $\Delta$ is the comultiplication of $C$. It is interesting since any right $C$-comodule $M$, then $M$ is a left module over the dual algebra $C^*$ by the following multiplication:

$$\rightarrow: C^* \otimes_R M \rightarrow M, f \otimes m \mapsto (I_M \otimes f) \circ g^M(m) = \sum m_0 f(m_1).$$

Hence the category of right $C$-comodule is a subcategory of left $C^*$-module, since every $C$-comodule morphism is a $C^*$-module morphism [15]. Analog for the left side, the category of left $C$-comodule is the subcategory of right $C^*$-module.

Moreover, to guarantee that the right $C$-comodule category (denoted by $\text{M}_C^C$) to be a full subcategory of the category of left $C^*$-module (denoted by $C^*\text{-M}$), we need to study the $\alpha$-condition. Following [15] the $R$-coalgebra $C$ satisfies the $\alpha$-condition provided for any $R$-module $L$, the following map is injective, i.e.,

$$\alpha_L : L \otimes_R C \rightarrow \text{Hom}_R(C^*, L), x \otimes c \mapsto [f \mapsto f(c)x].$$

The $\alpha$-condition of $C$ implies that the ring of right $C$-comodule endomorphisms of $M$ is isomorphic to the ring of left $C^*$-module endomorphisms of $M$. As the special case when we consider any $C$ is a (right and left) comodule over itself, we have a nice relationship i.e., $\text{End}_C^C(C) \cong C^*$ and $C\text{End}(C) \cong \text{End}_C(C) \cong C^*$ [15]. In this paper, we assumed that $C$ satisfies the $\alpha$ condition such that these fact would be used to get our goal.

For any ring $R$, we can consider $R$ as a trivial coassociative and counital coalgebra over itself by comultiplication $\Delta_T : R \rightarrow R \otimes_R R, r \mapsto r \otimes 1$ and counit $\varepsilon_T = I_T$ (the identity map of $R$). Moreover, any $R$-module $M$ can be considering as a comodule over $R$-coalgebra $R$ by trivial coaction $\rho^M_T : M \rightarrow M \otimes_R R, m \mapsto m \otimes 1$. Based on this fact, we have that ring $R$ is clean if and only if the endomorphism ring of $R$-coalgebra $R$ is a clean ring and the $R$-module $M$ is clean if and only if the endomorphism ring of $R$-comodule $M$ is clean. Hence, [16, 17] bring the cleanness concept of the category $\text{RING}$ and the category of modules ($\text{M}_R$) to the category of $C$-comodule ($\text{M}_C^C$).
The clean comodules also can be considered as a generalization of clean modules since any module is a trivial \(R\)-comodule. Clean comodules are defined as below:

**Definition 1.1.** [16, 17] Let \((C, \Delta, \varepsilon)\) be \(R\)-coalgebra (coassociative and counital). A right (left) \(C\)-comodule \(M\) is said to be clean if endomorphism ring of \(C\)-comodule \(M\) (denoted by \(\text{End}^C(M)\)) is clean.

Definition 1.1 means that for any \(f \in \text{End}^C(M)\), \(f = u + e\) where \(e \in \text{End}^C(M)\) is an idempotent and \(u \in \text{End}^C(M)\) is a unit. In this paper, since we assume that \(C\) satisfies the \(\alpha\)-condition, then \(\text{End}^C(M) \cong C \ast \text{End}(M)\). Thus, \(M\) is clean as a comodule over \(C\) if and only if \(M\) is a clean \(C^\ast\)-module.

Let \(C\) with comultiplication \(\Delta : C \to C \otimes_R C\). We can consider \(\Delta\) as a coaction of \(C\). As on the ring theory, we have that \(C\) is a comodule over itself [15].

In special case, take \(M = C\) (in Definition 1.1). On the following, we introduce a clean coalgebra. On the other hand, clean comodules is a generalization of clean coalgeras by taking \(M = C\).

**Definition 1.2.** [16, 17] Let \(R\) be a ring. An \(R\)-coalgebra \(C\) is called a clean coalgebra if \(C\) is a clean \(C\)-comodule over itself.

Definition 1.2 means that \(C\) is a clean coalgebra if \(C\) is clean as a \(C^\ast\)-module. Recall the properties of coalgebras in [15]. Any \(R\)-coalgebra \(C\) can be consider as a right and left comodule over itself. Therefore, \(C\) is a left and right \(C^\ast\)-module.

Since we assume that \(C\) satisfies the \(\alpha\)-condition, we have that \(C\) is a clean \(R\)-coalgebra if \(\text{End}_{C^\ast}(C) \cong C^\ast \text{End}(C) \cong C^\ast\) is a clean ring. In some article, the cleanness concept corner ring has been studied, i.e., \(R\) is clean if and only if \(eRe\) is clean for \(e\) an idemotent element of \(R\).

For any ring \(R\) and an idempotent \(e \in R\), \(eRe\) is called a corner ring. Motivated by the corner on the category \(\text{RING}\), we introduced the analogous notion of corner coalgebra under the multiplication \(\rightarrow\) and \(\leftarrow\) between \(C\) and \(C^\ast\) on Equation 2. Consider an \(R\)-coalgebra \((C, \Delta, \varepsilon)\) and an idempotent \(e \in C^\ast\), we can construct the \(R\)-coalgebra \(e \rightarrow C \leftarrow e\) based on the Equation 2 (right and left multiplication) and comultiplication \(\Delta\).

**Definition 1.3.** Let \(C\) be a coassociative and counital coalgebra and an idempotent \(e \in C^\ast\). The \(R\)-coalgebra \(e \rightarrow C \leftarrow e\) is called a corner \(R\)-coalgebra.

It is interesting to investigate the cleanness properties of corner coalgebra \(e \rightarrow C \leftarrow e\) for \(e \in C^\ast\), and for proving the main results of this paper, here we need to use the Morita Theorem.

In the Morita context, we have already known there is a relationship between the structure of \(P, P^\ast, R\) and \(S = \text{End}_R(P)\) [18]. The following theorem explains the relationship between \(P\) and its dual, in which it is essential to prove our main result.

**Theorem 1.4.** [18] Let \(R\) be a ring, \(P\) is a right \(R\)-module, \(S = \text{End}_R(P)\) and \(Q = P^\ast = \text{Hom}_R(P, R)\). If \(P\) is a generator in \(R\)–\(MOD\), then
Theorem 1.5. [18] Let $R$ be a ring, $P$ be a right $R$-module, $S = \text{End}_R(P)$ and $Q = P^* = \text{Hom}_R(P, R)$. If $P$ is finitely generated projective in $R-\text{MOD}$, then

1. $\beta: P \otimes_R Q \to S$ is an $(S, S)$-isomorphism;
2. $Q \cong \text{Hom}_S(SP, SS)$ as $(R, S)$-bimodules;
3. $P \cong \text{Hom}_S(QS, SS)$ as $(S, R)$-bimodules;
4. $R \cong \text{End}(SP) \cong \text{End}(QS)$ as rings.

On our main result, we are going to use the Theorem 1.5 and Theorem 1.4 to prove our main theorem. The main theorem of this article is to give the necessary and sufficient condition of clean $e \dashv C \rhd e$ where $e$ is an idempotent of $C^*$.

2. MAIN RESULTS

Given a coassociative and counital $R$-coalgebra $(C, \Delta, \varepsilon)$ with the $\alpha$-condition and $e$ be an idempotent element of $C^*$. The relationship between the clean ring of $R$ and $eRe$ motivate us to investigate the condition such that $R$-coalgebra $e \dashv C \rhd e$ is clean. In their article, [9] showed that $I$ is an ideal if and only if there exist idempotent set $\{e_1, e_2, \ldots, e_n\}$ such that $e_iRe_i$ is a clean ideal of $e_iRe_i$, for all $i$. In trivial cases $I = R$, we have $R$ is clean if and only if $e_iRe_i$ is a clean ring, for all $i$. We will observe this condition for coalgebra cases and find the sufficient and necessary condition of clean $R$-coalgebra $e_i \to C \leftarrow e$.

**Theorem 2.1.** If $C$ is a cocommutative clean $R$-coalgebra and $e$ is an idempotent in $C^*$, then $R$-coalgebra $e \dashv C \rhd e$ is also clean.

**Proof.** Let $C$ be a clean $R$-coalgebra. The ring $C \cdot \text{End}(C) \cong \text{End}^C(C) \cong C^*$ is clean. Since $C$ is locally projective, from [15], $e \to C \leftarrow e$ is also locally projective and implies

$$\text{End}(e \to C \leftarrow e) \cong (e \to C \leftarrow e)^* \cong e \cdot C^* \cdot e.$$ 

This means, the cleanness of $R$-coalgebra $e \to C \leftarrow e$ can be determined by the structure of ring $e \cdot C^* \cdot e$.

The $R$-coalgebra $C$ is cocommutative if and only if the dual algebra $C^*$ is commutative (by [15]). Since $C^*$ is a clean ring and commutative, $C^*$ is a strongly clean ring. By [9], $e \cdot C^* \cdot e$ is also strongly clean. Hence, $(e \to C \leftarrow e)^* \cong e \cdot C^* \cdot e$ is a clean ring. Consequently, $e \to C \leftarrow e$ is a clean $R$-coalgebra. For the converse, the following condition must be added in order to get the sufficient and necessary condition of the clean coalgebra $e \to C \leftarrow e$.
Theorem 2.2. Let \( C \) be a cocommutative \( R \)-coalgebra and \( e \) is a full idempotent in \( C^* \) (i.e., \( e * e = e \) and \( C^* * e * C^* = C^* \) where \( * \) is the convolution product of \( C^* \)). If \( e \rightarrow C \leftarrow e \) is a clean \( R \)-coalgebra, then \( C \) is clean.

Proof. Suppose that \( e \rightarrow C \leftarrow e \) is a clean \( R \)-coalgebra. Then by [15],
\[
\text{End}_{(e \rightarrow C \leftarrow e)^*}(e \rightarrow C \leftarrow e) \cong (e \rightarrow C \leftarrow e)^* \cong e * C^* * e
\]
is a clean ring. We will use the Morita Context and Morita Equivalences to prove that \( C^* \) is a clean ring (see Example 18.30 page 490 in [18] ).

Given the ring \( C^* \) with full idempotent \( e \) then \( e * C^* \) is a progenerator (finitely generated projective generator) \( C^*-\)module. Put \( P = e * C^* = \{ e * f [f \in C^*] \} \),
\[
Q = \text{Hom}_{C^*}(P,C^*) \cong C^* * e \text{ and } \text{End}_{C^*}(P) \cong e * C^* * e.
\]
In [18], the Morita context associated with \( P \) is \( (e * C^*, C^* * e, e * C^* * e, \alpha, \beta) \), with the isomorphism
\[
\alpha : C^* * e \otimes_{C^*} C^* * e \rightarrow C^*, \ f * e \otimes e * f' \mapsto f * e * f'
\]
\[
\beta : e * C^* \otimes C^*, C^* * e \rightarrow e * C^* * e, e * f \otimes e' \mapsto e * f * e'.
\]

By Morita Theorem, there is mutually inverse category equivalences:
\[
F = - \otimes_{C^*} (C^* * e) : C_\ast \rightarrow e * C^* * e, \ M \mapsto e * C^* * e, M
\]
\[
G = - \otimes_{e * C^* * e} (e * C^*) : e * C^* * e, M \mapsto e * C^* * e, M.
\]

Therefore, the ring \( C^* \) is Morita equivalence with ring \( e * C^* * e \), denoted by \( C^* \cong e * C^* * e \). Since \( C \) is a cocommutative coalgebra, \( C^* \) is commutative. Thus, \( e * C^* * e \) is also commutative. By consequences of Morita context, since \( C^* \cong e * C^* * e \) and \( C^*, e * C^* * e \) is commutative, the ring \( C^* \cong e * C^* * e \). By consequences of Morita context and Theorem 1.5, we have an isomorphism ring as below:
\[
e * C^* * e = \text{End}_{e * C^* * e}(C^*)
\]
\[
= \text{End}_{e * C^* * e}(C^* * e * C^*), \ \text{(since } e \text{ is a full idempotent)}
\]
\[
= \text{End}_{e * C^* * e}(C^* * e * C^*), \ \text{(by commutativity of } *)
\]
\[
= \text{End}_{C^*}(C^*)
\]
\[
= C^*.
\]

Therefore, the ring \( e * C^* * e \cong C^* \). As a consequence the fact that \( e * C^* * e \) is a clean ring, \( C^* \) is also clean and \( C \) is a clean \( R \)-coalgebra. The conclusion of the Theorem 2.1 and Theorem 2.2 yields the sufficient and necessary condition of \( R \)-coalgebra \( e \rightarrow C \leftarrow e \) to be clean. Assume that \( C \) satisfies the commutativity property in coalgebra theory and \( e \in C^* \) is a full idempotent. If \( C \) is clean, then \( e \rightarrow C \leftarrow e \) is also clean and true for the converse.

3. CONCLUDING REMARKS

This paper yields the condition for guarantee the \( R \) coalgebra \( e \rightarrow C \leftarrow e \) related to \( R \)-coalgebra \( C \). Hence, from the assumption that \( R \)-coalgebra \( C \) is...
cocommutative and $e \in C^*$ is a full idempotent, $C$ is clean if $e \Rightarrow C \Leftarrow e$ is a clean $R$-coalgebra and $e \Rightarrow C \Leftarrow e$ is clean if $C$ is a clean $R$-coalgebra.
